

Node.JS

Ex 2 – Building an Application

1. Create an application that sends an array of strings to a function which print to the console the total lengths of them.
2. Create a function "Add" that receives 2 numbers and return their sum.
Create a function "Mul" that receives 2 numbers and returns their multiply WITH OUT using the "*" operator but by calls to "Add" function.

Create a web server which serve an html page. The server will declare an array of the following couples : [[1,2], [3,4], [5,6]]. Use the Mul function for each of the array's couples numbers and create <H1> tags with the results as follows :

3. Debug the application and trace each of it's steps.
